

La Bohème Water & Related Systems

Water (Image 1)

The vessel carries 500 litres of fresh water in a round poly tank located behind the galley starboard wall. Water is pressurised to basin taps in the galley and the heads. An electric heater, located in the same space, supplies hot water. A filler hose is located on the starboard deck.

Heads (Image 2)

The WC (2009) has vacuum pump and hoses leading to a 250 litre black water tank located in the engine room.

The black water is pumped out while at sea.

There is also a heater, basin and tap in the heads.

1. Fresh water poly tank with electrical water heater (foreground)
2. Heads, with vacuum toilet, wash-basin and storage space above.

Shower (Image 3)

There is no fresh water shower, although plenty of space to install one. As the vessel was only used in high summer, salt-water showers were used.

3. Salt water shower, using genuine Swedish galvanised bucket.
